1. Demand Volatility Term (LT × σ_D²)

Accounts for daily consumption swings during normal lead time. Contributes 64.2% of total baseline variance.

LT: 25.8d • σ_D: 45% of Mean Demand

2. Supplier Lead Time Term (D² × σ_LT²)

Accounts for port bottlenecks and late PO arrivals. Contributes 35.8% of total baseline variance.

Quoted: 24.2d • Actual: 25.8d • σ_LT: 2.5d

3. Service Level Multiplier (Z-Score)

Controls stockout probability on the standard normal distribution curve. 95% = 1.65, 98% = 2.05, 99% = 2.33.

Non-linear exponential cost scaling above 98%
